## Matlab: Quick Reference

## May 2006

2006 Carolina Workshop on Force Measurement and Manipulation in Biological Microscopy

Matlab is a mathematics-friendly programming language used in the analysis and simulation of data It has syntactical similarities to C, C++, and Java. This Quick Reference uses Matlab version 6.5 (R13).

## How to get HELP

help $\quad$ display help text at command line. doc display HTML docs in the Help browser. demo run demonstrations.
open opens many matlab functions as well as any .m file you create.

\section*{Filename Extensions <br> | .m | script or function file |
| :---: | :--- | <br> .mat $\quad$ binary workspace file. <br> | .fig | Matlab figure or GUI template. |
| :---: | :--- | <br> .mex Matlab-executable.}

## Other Useful Tools

guide
GUI design environment.
simulink modeling environment.
SPTool signal processing tool.
FDATool
filter design \& analysis tool

| Matlab Editor Key Bindings |  |
| :---: | :--- |
| Ctrl + R | comment line/block. |
| $\mathrm{CtrI}+\mathrm{T}$ | uncomment line/block. |
| $\mathrm{CtrI}+\{$ | promote indentation. |
| $\mathrm{CtrI}+\}$ | demote indentation. |
| F 5 | start execution of script. |
| $\mathrm{CtrI}+\mathrm{s}$ | save file. |
| $\mathrm{Ctrl}+\mathrm{f}$ | open find-replace dialog. |
| $\mathrm{Ctrl}+\mathrm{b}$ | balance delimiters. |

## Debugging Hints

dbstop set debugging stop.

| dbclear | clear debugging stop. |
| :--- | :--- | dbquit $\quad$ exit debug mode.

Remove semicolons at the end of lines to print output to command window.
Stick to one-function one-task philosophy. Comment your m-files thoroughly, including header comments for real-time help later. Use ellipses (...) to continue long lines of code to the next line.
Try using functions instead of scripts to avoid mangling values of variables.
Check for function name overloading. Making a variable named 'sum' is a bad idea if you want to use the 'sum' function later in your code.
Use global variables only when necessary.

## Scripts vs. Functions

Scripts contain a list of commands that Matlab simply executes in order. They are useful to batch simple sequences of commonly used commands together. Scripts operate on existing data in the base workspace or on data they create or load.
Functions are m-files that can accept and return arguments. A function operates on variables within its own workspace and is useful for operating repeatedly on data in a specific way.

## Code Optimization

'Vectorize' code to speed up processing. Find ways around using for-loops or while-loops.

## Anatomy of a function <br> function $v=$ function_name(arg1, arg2) <br> v = arg1 + arg2;

## Special Constants

| ans | most recent answer. |
| :--- | :--- |

| eps | smallest floating-point value possible. <br> i.e. 'epsilon'. |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| NaN | Not-a-Number. |  |  |  |  |
| pi | i,j | true | false | inf |  |
| $3.14 \ldots$ | sqrt(-1) | 1 | 0 | infinity |  |

## Special Characters

\% encloses strings or matrix transpose.
! Runs OS-level program.
, $\quad$ Separates matrix column entries. Used in element-wise math ops or separates var names from fieldnames. ; $\quad$ Suppresses output, or marks end of row. () reference elements of arrays. also used to
() alter standard order of operation. also encloses parameters during function call. [] encloses definition of matrix/array. \{ \} define/reference elements of cell array.

\section*{Common Object Types <br> | scalar | single value. $1 \times 1$ array. |
| :---: | :--- | <br> vector $\quad$ row or col matrices. 1D arrays. <br> matrix arrays of 2+ dimensions. <br> struct $\quad$ structure array. <br> cell multidim arrays whose elements can <br> array be of mixed data/object types. <br> class used for object design}

| Casting |  |  | Data Types |
| :--- | :--- | :---: | :---: |
| str2num | convert string to number. |  |  |
| numsstr | convert tumber to ostring. |  |  |
| int2str | convert integer to sting |  |  |
| double | convert tod olouble precicion. |  |  |
| uint8 | unsigned 8 -bit integer. |  |  |

\section*{Strings <br> | strcmp | compare two strings. |
| :--- | :--- |
| findstr | find string A within string B. |
| strrep | replace string with another. |
| concatenate | mystring = [str1 str2]; |}

## Printing Output

disp $\quad$ display string or array.
fprintf $\quad$ print formatted data to screen/ file.

| Function Input/Output |  |
| :--- | :--- |
| nargin | \# of input arguments. |
| nargout | \# of output arguments. |
| varargin | variable length input argument list <br> as cell array. |
| varargout | variable length output argument <br> list as cell array. |

## Colon Operator

| count a to b, by <br> stepsize s. | $\mathrm{d}=\mathrm{a}: \mathrm{s}: \mathrm{b} ;$ |
| :--- | :--- |
| count 1-10 | $\mathrm{d}=1: 10 ;$ |
| $0-10$, evens | $\mathrm{d}=0: 2: 10 ;$ |
| count down | $\mathrm{d}=10:-1: 1 ;$ |

## Testing Cases

| exist | true if variable is defined. |
| :--- | :--- |
| isempty | true for empty array. |
| isnan | true for Not-a-Number. |
| isfield | true if field exists in structure. |

## Sizing Things

| length | length of vector (1D). |
| :--- | :--- |

| size | Size of n-dimensional array. |
| :--- | :--- |

| Manipulating Arrays |  |
| :---: | :---: |
| zeros | create an array of zeros. |
| ones | create an array of ones. |
| repmat | replicate and tile an array. |
| sort | sort elements. |
| sortrows | sort rows by a column. |
| flipud | flip matrices up-down. |
| concat rows | $\mathrm{M}=[\mathrm{m} 1 ; \mathrm{m} 2]$ |
| concat cols | $\mathrm{M}=[\mathrm{m} 1 \mathrm{~m} 2]$ |
| select row | d = mymatrix(row,:); |
| delete row | mymatrix(row,:) = []; |
| set row = 5 | mymatrix(row,:) = 5; |
| set col $=5$ | mymatrix(:,col) = 5; |

## Operators \& Precedence

Precedence levels are defined by each band of contiguous color \& are eval. by Matlab from left to right.

| () | parentheses |
| :---: | :---: |
| . | matrix transpose |
| ${ }^{\wedge}$ | power, element-wise |
| , | complex-conjugate transpose |
| $\wedge$ | matrix power |
| + | unary plus |
| - | unary minus |
| $\sim$ | logical negation |
| * | multiplication, element-wise. |
| . $/$ | division, element-wise |
| . 1 | left-division, element-wise |
| * | matrix multiplication |
| 1 | matrix division |
| 1 | matrix left-division |
| + | addition |
| - | subtraction |
| : | colon operator |
| < | less than |
| <= | less than or equal to |
| $>$ | greater than |
| >= | greater than or equal to |
| = | equal to |
| ~= | not equal to |
| \& | and, element-wise |
| 1 | or, element-wise |
| = | assign value to ... |

| Flow Control |  |
| :---: | :---: |
| if... elseif... else... end | ```if myarmy.size < yourarmy.size a = recruit_forces; elseif myarmy.size > yourarmy.size a = begin_invasion; else a = init_cheat_seq; end``` |
| switch... <br> case... <br> end | ```switch weekday case 'Monday' mood = 'black'; case 'Tuesday' mood = 'blue'; otherwise mood = 'green'; end``` |
| while... end | ```while (~weekend) work_hard_4_the_money(); end``` |
| for... end | ```for k = 1 : 7 mysevens(k) = 7*k; end``` |
| break | break out of while/for-loop. |
| continue | pass control to next iteration. |
| pause | wait for time-period or user response. |
| tic/toc | stopwatch timer. |

## find

Find is a useful function that searches within a
variable without using for－loops．Find operates on a variable and returns the vector containing index values that match its conditional input．
$\left.\begin{array}{l}\text { values that match its conditional input．} \\ \hline q<10 ? \\ \hline \text { foo }==\text { true？} \\ \begin{array}{ll}\text { idx＝find（q＜10）；} \\ \text { my＿q＝q（idx）；}\end{array} \\ \hline\end{array} \begin{array}{l}\text { idx＝find（foo＝＝true）；} \\ \text { my＿foo＝foo（idx）；}\end{array}\right]$

| Hanc | g Errors |
| :---: | :---: |
| ${ }^{\text {Warning }}$ | display warning message． |
|  | exeerion handiling．＂try a |
| ${ }^{\text {coarch }}$ | tion |

| File I／O |  |
| :---: | :---: |
| Is，dir | Iist directory contents． |
|  | load workspace or text flie from disk． |
| dead | save workspace or rext ine |
| cswwite | Write comma sep．value file． |
| topen | open file． |
|  | Cosest ile |
| tread | reaa binary Cata tom ine． |
| ${ }^{\text {mater }}$ |  |

| Plotting \＆Figures |  |
| :---: | :---: |
| pplot | create axes in itied position |
| Semilogx | log10（x），ineary 20 plot． |
| ${ }^{\text {Semilogy }}$ |  |
| plois | plot tines and points in 3 －D． |
| hist | histogram． |
| image |  |
| Contour |  |
| sh | 3．D mesh surface． |
| surf | 3－D colored surface． |

| Images |  |
| :---: | :---: |
|  | read image from file． |
| imwite | witie image to file． |
| imshow | display image fiom file． |
|  |  |
|  | math functions between two <br> images |
| regionpropst | measure properties of image |

＊requires imaging toolbox．

## Animation

| aviinfo | information about AVI file． |
| :--- | :--- | avifile $\quad$ create a new AVI file． addframe $\quad$ add a frame to AVI object． aviread $\quad$ read／open AVI file．

## Common Errors

＂inner matrix dimensions must agree＂
You tried to multiply two matrices．Did you want to multiply them element－by－element？ index exceeds matrix dimensions＂

You tried to access an element of an array with an index value that was greater than the size of the array．
＂All matrices on a row in the bracketed expression must have the same number of rows．＂

You tried to concatenate two matrices of dissimilar size．Maybe transpose one？
In an assignment $A(:$, matrix $)=B$ ，the number of rows in $A$ and $B$ must be the same．

Check the sizes of both A and B．Chances are you are trying to set a row or column equal to an element（single value），or an element （single value）to a row or column．

\section*{Multidimension Handling <br> | squeeze | remove singleton dimensions．A <br> singleton dimension is any dim for <br> which size $(A, d i m)=1$. |
| :--- | :--- |
| datagrid | data gridding \＆surface fitting． |
| meshgrid | $X$ and Y arrays for 3－D plots． |}

## Standard Math

| sqrt | square root． |
| :--- | :--- |
| abs | absolute value． |
| log | natural logarithm． |
| log10 | base－10 logarithm． |
| round | round to nearest integer． |
| floor | round down． |
| ceil | round up． |
| rand | uniform dist．random \＃＇s． |
| randn | Gaussian dist．random \＃＇s． |

| Comp／ex Math |  |
| :--- | :--- |
| real | complex real part． |
| imag | complex imaginary part． |
| abs | complex modulus． |
| angle | phase angle． |
| conj | complex conjugate． |

| Algebra |  |
| :--- | :--- |
| roots | find polynomial roots． |
| poly | convert roots to polynomial． |

| Trigonometric Functions |  |  |  |
| :--- | :--- | :--- | :--- |
| $\sin$ | $\operatorname{asin}$ | $\tan$ | $\operatorname{atan}$ |
| $\cos$ | $\operatorname{acos}$ |  | $\operatorname{atan} 2$ |

Differential Equations
ode23 $\quad$ solve DiffEqs，low order fit．
ode45

## Signal Processing

| conv | convolution and polynomial <br> multiplication． |
| :--- | :--- |
| xcorr | auto－and cross－correlation |
| filter | 1－D digital filter． |
| fft | fast－fourier transform |
| pwelch | power spectral density |
| tfe | transfer function estimate |

Statistics

| sum | sum of elements． |
| :--- | :--- |
| nansum＊ | sum ignoring NaNs． |
| cumsum | cumulative sum． |
| mean | average or mean value． |
| std | standard deviation． |
| var | variance． |
| max | largest component． |
| min | smallest component． |
| range＊ | diff between max \＆min． |

＊requires Statistics Toolbox．

| Curve Fiting（Regression） |  |
| :--- | :--- |
| polyfit | fit polynomial to data． |
| polyval | evaluate polynomial． |
| corrcoeff | correlation coefficients． |
| Isqcurvefit | solves non－linear least squares <br> problems． |

## Symbolic＊

| syms $^{*}$ | construct symbolic objects |
| :--- | :--- |

subs＊$\quad$ symbolic substitution．
simplify＊${ }^{*}$ symbolic simplification．
pretty＊prettily print a symbolic expression．
＊requires Symbolic Math Toolbox．
